

# Demonstration 2

Operators [Arithmetic, Logical, Set Theory ]

# Restricting and Sorting Data

---

- Restrict the rows returned by using the WHERE clause

```
SELECT column_name(s)
FROM table_name
WHERE column_name operator value
```

**Operators :** =, <, >, >=, <=, <>, BETWEEN, LIKE, IN

```
SELECT column_name(s)
FROM table_name
WHERE column_name1 = 'XYZ'
```

# Logical Operators

---

Allow you to combine two or more conditions in the WHERE clause  
AND, OR, NOT, IN, BETWEEN

## AND & OR Operators

- ▶ The AND operator displays a record if both the first condition and the second condition is true.
  - ▶ The OR operator displays a record if either the first condition or the second condition is true.
  - ▶ `SELECT * FROM Table WHERE attribute1=value1  
AND attribute2=value2;`
  - ▶ `SELECT * FROM Table WHERE attribute1=value1  
OR attribute2=value2;`
  - ▶ `SELECT * FROM Table WHERE attribute1=value1  
AND (attribute2=value2 OR attribute3=value3);`
- 

# LIKE Operator

---

- ▶ The LIKE operator is used to search for a specified pattern in a column.
- ▶ 

```
SELECT column_name(s)  
FROM table_name  
WHERE column_name LIKE pattern
```
- ▶ Pattern → ‘%pattern’ or ‘pattern%’ or ‘%pattern%’

# The IN Operator

---

- ▶ The IN operator allows you to specify multiple values in a WHERE clause.
- ▶ 

```
SELECT column_name(s)  
FROM table_name  
WHERE column_name IN (value1,value2,...);
```

# The BETWEEN Operator

---

- ▶ The BETWEEN operator selects a range of data between two values. The values can be numbers, text, or dates.
- ▶ 

```
SELECT column_name(s)  
FROM table_name  
WHERE column_name  
BETWEEN value1 AND value2;
```

# The UNION operator

---

- ▶ The UNION operator is used to combine the result-set of two or more SELECT statements.
- ▶ **Note:**
  - ▶ each SELECT statement within the UNION must have the same number of columns.
  - ▶ the columns must also have similar data types.
  - ▶ also, the columns in each SELECT statement must be in the same order.
- ▶ 

```
SELECT column_name(s) FROM table_name1  
UNION  
SELECT column_name(s) FROM table_name2
```
- ▶ The UNION operator selects only distinct values by default. To allow duplicate values, use UNION ALL.

# The INTERSECTION operator

---

- ▶ `SELECT column_name(s) FROM table_name1  
INTERSECTION  
SELECT column_name(s) FROM table_name2`

## **Difference**

- ▶ `SELECT column_name(s) FROM table_name1  
MINUS  
SELECT column_name(s) FROM table_name2`

# The ORDER BY Keyword

---

- ▶ The ORDER BY keyword is used to sort the result-set by a specified column.
- ▶ `SELECT column_name(s)`  
`FROM table_name`  
`ORDER BY column_name(s) ASC | DESC`

# Joining Multiple Tables

---

- ▶ A Join Combines data from multiple tables using foreign key references

- ▶ **Syntax**

```
SELECT column1, column2, ...
```

```
FROM table1, table2
```

```
WHERE table1.joincolumn = table2.joincolumn
```

```
AND search_condition(s);
```

# SQL Alias

---

- ▶ **SQL Alias Syntax for Tables**
- ▶ `SELECT column_name(s) FROM table_name  
AS alias_name`
- ▶ **SQL Alias Syntax for Columns**
- ▶ `SELECT column_name AS alias_name  
FROM table_name`

# SQL Aggregate Functions

---

- ▶ SQL aggregate functions return a single value, calculated from values in a column.
- ▶ Useful aggregate functions:
  - ▶ `AVG()` - Returns the average value
  - ▶ `COUNT()` - Returns the number of rows
  - ▶ `MAX()` - Returns the largest value
  - ▶ `MIN()` - Returns the smallest value
  - ▶ `SUM()` - Returns the sum

# The **SUM()** and **AVG()** Function

---

- ▶ The **SUM()** function returns the total sum of a numeric column.
- ▶ `SELECT SUM(column_name) FROM table_name`
- ▶ The **AVG()** function returns the average value of a numeric column.
- ▶ `SELECT AVG(column_name) <AS avg_Col_name>  
FROM table_name`

# The COUNT() Function

---

- ▶ The **COUNT(column\_name)** function returns the number of values (**NULL** values will not be counted) of the specified column
- ▶ **SELECT COUNT(column\_name) FROM table\_name**
  
- ▶ The **COUNT(\*)** function returns the number of records in a table
- ▶ **SELECT COUNT(\*) FROM table\_name**
  
- ▶ The **COUNT(DISTINCT column\_name)** function returns the number of distinct values of the specified column
- ▶ **SELECT COUNT(DISTINCT column\_name) FROM table\_name**

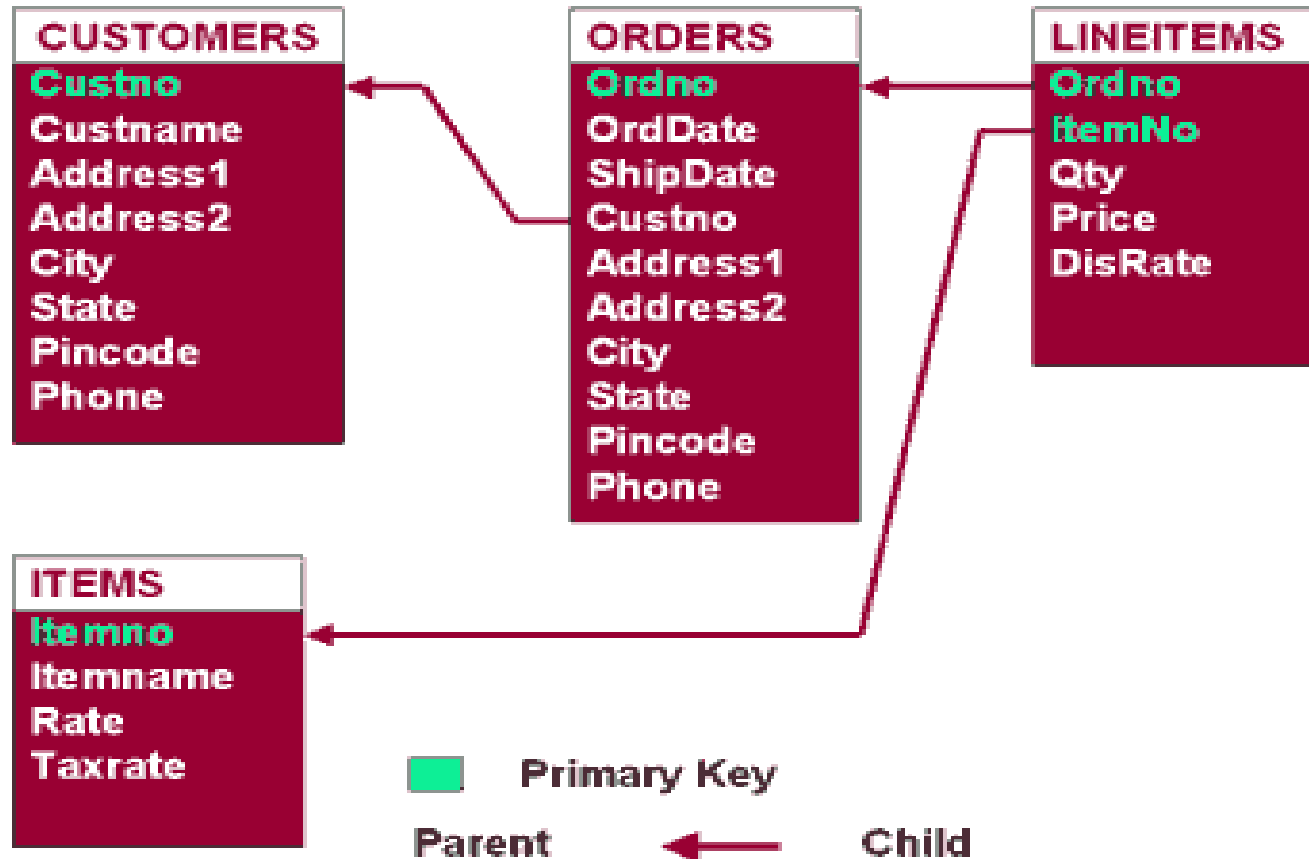

# The **MAX()** and **MIN()** Function

---

- ▶ The **MAX()** function returns the largest value of the selected column.
- ▶ `SELECT MAX(column_name) FROM table_name`
- ▶ The **MIN()** function returns the smallest value of the selected column.
- ▶ `SELECT MIN(column_name) FROM table_name`

# Purchase Order Example

# Queries

---

- ▶ Display details of orders that were placed in the month of june 2003.
  - ▶ Display customer names who stays in karnataka state
  - ▶ Display details of items where itemname contains letter 'o' twice
  - ▶ Display all the orders that are placed in the current month
  - ▶ Display orderno,orderdate,custno,name for all the orders where the order contains order for itemno 5.
  - ▶ Display itemno,name,orderno,custname and amount.
  - ▶ Display orderno,custname,orderdate,no.of days between shipdate and orderdate for orders that have been shipped
  - ▶ Display orderno,orderdate,custno,custname for all the orders where the order contains order for itemno 5.
  - ▶ Display the details of items where itemname contains letter o or m
- 

# Queries Contd..

---

- ▶ Display the details of orders that placed in the last 20 days and delivered.
- ▶ Change the rate of items in order 1003 so that 10% discount is given to all items.
- ▶ Display the items where itemname contains more than 10 characters.
- ▶ Display itemno,itemname in upper case for all items where the letter 'm' is existing in any case.
- ▶ Display the orders that are placed in the current month.
- ▶ Display how many orders are still pending.

# The GROUP BY Statement

---

- ▶ The GROUP BY statement is used in conjunction with the aggregate functions to group the result-set by one or more columns.
- ▶ 

```
SELECT column_name, aggregate_function(column_name)
FROM table_name
WHERE column_name operator value
GROUP BY column_name
```

# The HAVING Clause

---

- ▶ The HAVING clause was added to SQL because the WHERE keyword could not be used with aggregate functions.
- ▶ 

```
SELECT column_name, aggregate_function(column_name)
FROM table_name
WHERE column_name operator value
GROUP BY column_name
HAVING aggregate_function(column_name) operator
value
```
